ELECTRONIC HEALTH RECORDS

Adaptive EHR is a comprehensive web based on-line health records system that addresses the real-life need to organize, collect, report and analyze information for providers who care for clients with mental illness and developmental disabilities. It is the core of the Adaptive Care Software solution: Adaptive EHR for managing client records, Adaptive MAR for Medication Administration Reports, and Adaptive HR for Human Resource Scheduling and Management.

Easy to learn and use, Adaptive Care Software Solutions enables providers to literally take “INCHES” out of client binders. Information becomes accessible to all authorized individuals with web access, no matter where they are located, 24 hours a day, 7 days a week. At a glance, responsible individuals can monitor the status of client records including ISP, risk management, formal objectives, incident reports, and more.

Upon logging in, users see company-wide announcements, home specific calendar items, their personal time records and the staff schedule for their location. Staff has access to client information based on their authorized locations and care roles.

To make charting easy for even the most inexperienced computer user, data entry screens make heavy use of icons, check boxes, and drop-down lists. When users select a topic icon they are taken to a well organized form where they simply check the “service completed as planned box” or the appropriate response from a drop down list to record why the service wasn’t completed. Minimal typing skills are necessary yet there is always room for full text recording for complete record keeping.

Crystal Reports™ is the foundation of all standard reporting and analysis tools, which makes them extremely flexible and easy to customize. We are confident that we can fulfill virtually any reporting requirement.

Adaptive Care Software helps care providers dramatically reduce time spent on charting and reporting, making more time for planning and delivering the best client care possible.

Electronic Health Records are no longer a luxury providers need an easy to use system to ensure record portability, plan and document client care, produce ever more complex reports, and to operate profitably.
