MEDICATION ADMINISTRATION RECORDS

Adaptive MAR enables care providers to efficiently and effectively monitor any combination of prescription and PRN medications even without Internet access. Once the internet becomes available Adaptive Synchronization reconciles off-line charting with the core data base. Adaptive MAR is available standalone or tightly integrated with Adaptive EHR for managing client records and Adaptive HR for Human Resource Scheduling and Management.

Once Standing Order medication strength and dose schedules are entered into the system for prescription or PRN medications, nursing staff have an easy to use form to record successful administration or errors, with reason codes and notes. Easy to use forms help staff manage what can be a very complex task, helping them avoid errors. The system can track all changes in medications, and produces a complete MAR report on-demand, even in off-line remote mode.

Create automatic reminders for staff with the appointment scheduling calendar to keep everyone on track. Generate a comprehensive appointment report to be taken along to any medical or health appointment. A Physician's Change Order form is even included in this set and the Change Order can be accessed and updated online.

The Pharmacy Portal option allows providers to grant access to a client's pharmacist who can update and manage their personal prescription inventories. There is also the ability to partner with pharmacies who can manage all your medications including the over-night delivery of prescription refills to your locations along with the MAR form to use in recording administration. This arrangement frees staff time, helps to avoid unsafe drug interactions and assures that your organization's Medical Administration and Recording processes are the most effective and efficient possible. Collaborating directly with a client's pharmacy not only saves time, but further ensures accuracy and compliance while reducing costs at the same time.

Adaptive Care Software Solutions are affordable and accessible to all size organizations and can dramatically reduce time spent on medication management and reporting, making more time for planning and delivering the best client care possible.

Electronic Health Records are no longer a luxury; providers need an easy to use system to ensure record portability, plan and document client care, produce ever more complex reports, and to operate profitably.
